## LS-40-V VME Bit Synchronizer

### Data Sheet

#### Description:

The Lumistar LS-40-V VME Bit Synchronizer provides optimal reconstruction of a serial PCM data stream that has been corrupted by noise, phase jitter, amplitude modulation, or base line variations. The all-digital design assures a consistent product with high reliability and long-term stability. *The LS-40-V VME Bit Synchronizer consists of the LS-40-DB Bit Synchronizer Daughterboard shown below mounted on a 6U VME carrier board.*

A unique Built-in-Test feature allows performance verification for Bit Synchronizer and overall system. *Auto-test BIT* is performed for a short duration on the application of power and tests 90% of the Bit Synchronizer components. This test verifies that power is properly applied, measures internal bit error rate, and performs other tests to ensure that the bit synchronizer is fully operational. *Command-test BIT* performs the same functions and can be commanded by the user at any time.

#### Key Features:

- Up to 25 Mbps for NRZ-L (12.5 Mbps for Bi-Phase/Miller) PCM data codes
- Performance within 1 dB of theoretical to 10 Mbps (1.5 dB to 25 Mbps)
- Low power consumption
- All Digital Design ensures high reliability and long term performance
- Built-in-Test allows internal auto-test or command-test BER measurement
- Software selectable inputs (1 of 7)

#### Synchronization Hold:

The LS-40 Bit Synchronizer is capable of maintaining synchronization during periods of signal loss or during continuous periods of 1s or 0s lasting up to 245 bits in every 1024 bits, for NRZ coded signals up to 5 Mbps or BIφ coded signals up to 2.5 Mbps, providing:

- S/N ratio is greater than 12 dB
- PLL bandwidth is equal to 0.1%
- 50% Transition Density when the signal is present
- Input signal has no jitter or base line variations
- Signal has a constant amplitude

#### Phase-Locked Loop Performance:

Loop-Bandwidth: Programmable from 0.01% to 2% depending on the Bit Rate of the input signal.  
 Acquisition Range: 0.04% to 8% depending on the Loop-Bandwidth selected  
 Tracking Range: 0.1% to 20% depending on the Loop-Bandwidth selected

#### Acquisition Time:

The mean acquisition time is a function of the Loop Bandwidth and will be less than 100 bits with a Loop Bandwidth of 1% and less than 150 bits with a Loop Bandwidth of 0.1% for NRZ signals up to 5 Mbps or BIφ signals up to 2.5 Mbps, providing:

- Gaussian white noise in a band up to three times the bit rate
- Transition Density is greater than 2% of the bit rate
